

Xodus' XAMIN Digital ERAP

The Emissions & Climate team within Xodus are world leaders in the field of energy and emissions assessment and management. Xodus have delivered a large quantity of ERAPs across the North Sea and developed the XAMIN Digital ERAP to efficiently and accurately meet ERAP reporting requirements and to transition away from a static document that is reviewed annually.

The XAMIN Digital ERAP (D-ERAP) is a secure web-based solution, to digitally **store**, **evaluate** and **manage** emissions reduction opportunities (EROs) and action plans for an asset or portfolio of assets.

Designed to align with the reporting requirements of the Stewardship Expectation 11, it is an innovative multi-user system that is **fully auditable** and **easily updateable**, allowing for regular updates to be made to align with regulatory/stakeholder requirements and drive engagement in emissions reduction across your organisation.

The XAMIN D-ERAP provides **robust emissions and financial benefit calculations**, considering asset specific information such as production profiles, power generation operating mode & efficiency, gas compositions and emissions factors.

This single source of EROs **enables consistent ranking** to aid selection using customisable ranking scales and tracking of EROs to show progress for ongoing evaluation and implementation.

The XAMIN D-ERAP enables **scenario analysis** through grouping of opportunities into various abatement scenarios as part of the action plan development, providing accurate action plan emissions forecasting by **considering how opportunities will interact with each other**.

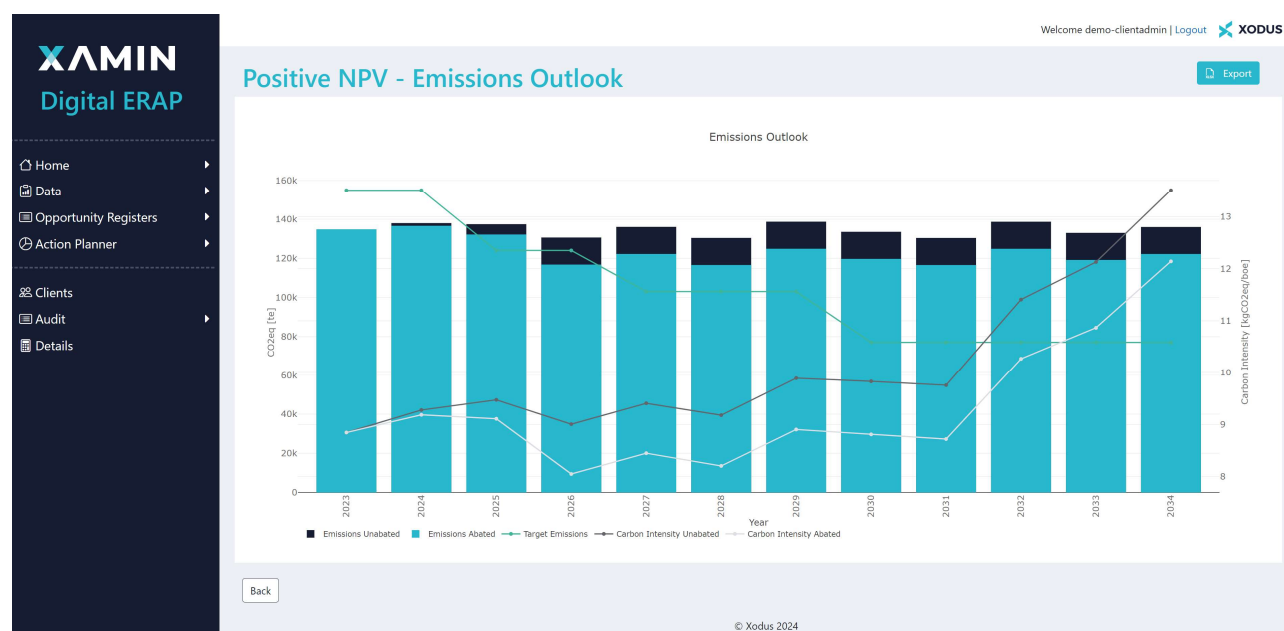

The scenario comparison functionality facilitates comparison of abatement plans, with the ability to create **sensitivities** on key variables such as COP date, implementation schedules, economic profiles etc. This allows stakeholders to **compare reduction pathways**, promoting buy-in at all levels to the funding, actions and the

timeline required to meet basin targets.

The XAMIN D-ERAP has the capability to provide a breakdown of emissions on an individual constituent GHG basis. Xodus understand the value of reporting both **absolute emissions** and **emissions intensity**.
