

SUSTAINABLE ENERGY SOLUTIONS

Technology Showcase on CCS MMV

North Sea Transition Authority 29th October 2024

## **CO<sub>2</sub> Storage Well Lifecycle**

#### **E&A of New Fields**

- Integrated well testing
- Fluids sampling and analysis
- · Downhole monitoring
- Subsea Well Access
- · Well Intervention

## Repurposing Depleted Fields

- Well Intervention
- Downhole monitoring

#### **P&A of Legacy Wells**

- Well Intervention
- Well Construction
- Subsea Well Access
- Downhole monitoring

# Development

#### Field Development

- Tubular Running Services (TRS)
- Casing & completions running
- Drilling technologies
- Cement heads
- Cement technologies
- Conductor driving
- · Well Test

#### **Life of Field Services**

- Well Intervention
- Fluids sampling and analysis
- Well Test
- TCP
- Downhole Monitoring
- Subsea Well Access
- Production Solutions

CO<sub>2</sub> injection (operations & CO) maintenance)

#### **Long-Term Monitoring**

- Well Intervention
- Downhole Monitoring
- Fluids sampling and analysis

Post-closure long-term monitoring

Resource evaluation

Design

3-5 years 1-5 years 1-3 years 10-40 years 10-100 years

## **CaTS™** Wireless Downhole Monitoring

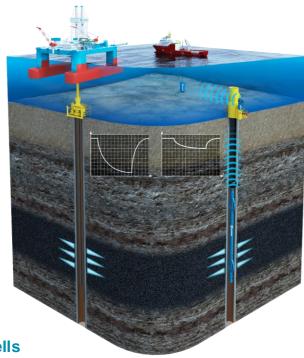

### The next generation of downhole surveillance

#### **Function**

- System records pressure and temperature and transmits the readings wirelessly to surface
- Uses **metallic structure** of the well (casing or tubing) as a conduit to transmit **electromagnetic (EM) signals** to surface

#### **Technology**

- Long EM transmission distances from downhole gauges at depths Record distance > 12,500ft in single-hop
- EM signal is not impacted by mechanical barriers or cement plugs, so is perfectly suited to abandoned and suspended wells
- Uses industry leading Quartz crystal transducer for high accuracy, good resolution and importantly low drift over time
- Addressable enabling multiple gauge installations in a well
- Duplex functionality to optimise system performance and deliver critical data at the right time

# **CaTS™** Wireless Downhole Monitoring

## Enabling long-term wireless surveillance of isolated and abandoned zones for CO<sub>2</sub> storage projects

**Challenge:** How to collect P&T data from abandoned and suspended wells/zones?

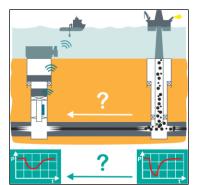

- **Solution:** CaTS P&T system installed in abandoned zone to detect changes in conditions and validate subsurface models.
  - 1. Long term pressure build-up or injection/fall-off test after appraisal test to "look deeper" into the reservoir
  - 2. Interference testing from well testing during appraisal or injection to reduce uncertainties in reservoir
  - 3. Pressure front and plume tracking in reservoir as a result of CO<sub>2</sub> injection

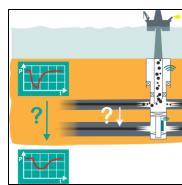

**Challenge:** How to monitor for leaks in and around the well bore?

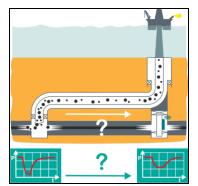

- Solution: CaTS gauges installed within injection zone or above the confining layer for long-term well integrity surveillance
  - 1. Installed within well bore in new well run as part of completion
  - 2. Retrofit into existing well bore (keeper or future abandonment)

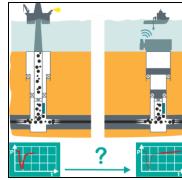

**Challenge:** How to monitor behind casing?

- Solution: Install CaTS gauges behind casings with externally mounted perforating systems, to allow direct formation sensing from isolated and cemented intervals
  - 1. Timer activated guns / with interlocks
  - 2. Wirelessly activated guns (new product development)

"By the application of CaTS technology, well testing no longer has to end at well suspension / abandonment. CaTS allows the acquisition of qualitative reservoir data from suspended and abandoned wells to make informed decisions to optimise developments, save cost and reduce risk."

## **Distributed Fibre Optic Sensing (DFOS) Intervention**

From deployment to evaluation to remediation, Distributed Fibre Optic Sensing Intervention gives you enhanced insight into your well

Distributed Fibre Optic Sensing (DFOS) Slickline allows well performance to be assessed over its entire length during a Slickline intervention.

#### **Applications:**

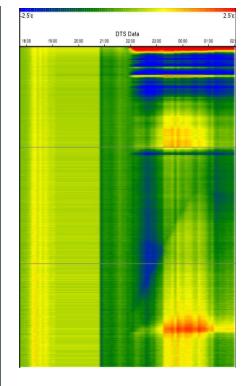

- Integrity assessment for length of well:
  - Leak detection
  - · Behind casing crossflows
  - Overburden survey
- · Production and injection profiling
- Pre-abandonment surveys

#### **Features and Benefits:**

- Easy to deploy
- Enables distributed temperature and acoustic sensing
- · Monitors dynamic behaviour
- Fast processing of data on-site enables remediation to take place during the same rig up or intervention campaign
- · Other logging tools can be deployed on the bottom of the DFOS Slickline to maximise the intervention opportunity

Using thru-tubing fibre optic deployment to enable operators optimise their well stock in real time

# **Distributed Fibre Optic Sensing (DFOS) Intervention**

## **Monitoring applications**

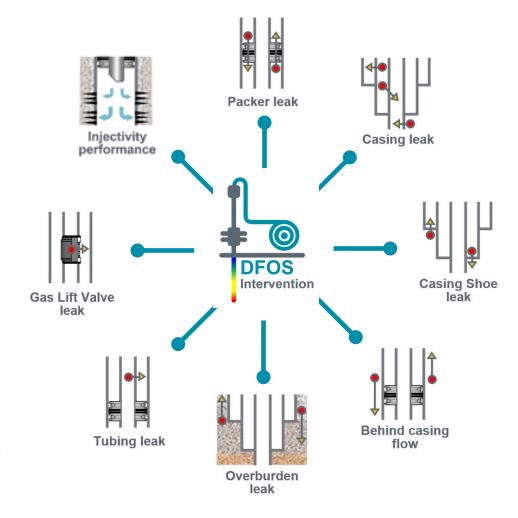

Multiple well integrity scenarios can be evaluated using distributed fibre optic sensing technology. Distributed fiber optic sensing technology has, however, predominantly been in the domain of permanent systems installed as part of the completion.

Well surveillance using thru-tubing deployed DFOS enables the identification and diagnosis of well integrity and flow assurance issues in wells where there is no permanent FO system installed or it is no longer in operation.

A typical in-well survey using DFOS takes less than 12 hours, with rapid turn around of the data at the well site enabling remediation activities to be executed during the same intervention campaign.

## **Summary**

- Wireless gauge data enables monitoring of reservoirs and wells that was **previously impossible**.
- Technology advances delivers more data and longer system life, enabling greater risk reduction and further insight for future decision making.
- DFOS intervention enables **real-time DAS/DTS** across the entire length of the well (including reservoir)
- Advance data processing allows operational parameters to be changed immediately to improve well performance.
- Both systems enhance reservoir characterization, well integrity assurance and performance optimization.
- These technologies have **applications across the well lifecycle**, from E&A, development, operations and long-term post-abandonment monitoring and can support the wider MMV strategy.
- Both systems are fully commercialized and have extensive track record in oil and gas.
